

Contents

Introduction and a brief historical review	3
Conventional symbols used in the book	8
Chapter I. Description of the author's invention	10
1.1. Calculation method to control catastrophic destruction	10
1.2. Description of invention	11
1.2.1. Object—phenomenon	11
1.2.2. Introduction	11
1.2.3. Justification of invention	12
1.2.4. Formula of invention.....	13
1.3. Description of invention	18
1.3.1. Object —law.....	18
1.3.2. Introduction	18
1.3.3. Justification of invention.....	19
1.3.4. Formula of invention.....	22
1.4. Description of invention	31
1.4.1. Object —law.....	31
1.4.2. Introduction	31
1.4.3. Justification of invention.....	33
1.4.4. Formula of invention.....	34
Chapter II. The method of analogy in stability of thin walled constructions (a general linear theory of stability)	42
2.1. Setting of the problem on stability of eccentrically compressed bar and ways of its solution	42
2.2. Loss of stability "in small" and "in big"	50
2.3. Possible forms of stability loss "in big". Solution of differential equation of the form $Y^{IV} + AY = 0$	52
2.4. Classification of load combination in stability. A concept of analogy	68
2.5. The theorem on analogy in stability	71
2.6. The analogy method in calculations on stability of centrally and eccentrically compressed thin walled bars. Calculation of the examples was performed using a computer.....	75
2.7. Experimental grounding of the analogy method and correction provided by the experiment for the calculations on normative technique	89

2.8. The analogy method in calculations on stability of the beam loaded with a concentrated load in the middle of the span	93
2.9. The analogy method in calculations on stability of the beam loaded with the load evenly distributed by the length	102
2.10. The analogy method in calculations on stability of the beam loaded with concentrated moments at bearings	111
2.11. Method of analogy in calculations on stability of thin plates and gentle cylindrical shells	120
Chapter III. Application of the method of analogy in calculation on stability of construction elements of bridges and flying apparatus	132
3.1. Introduction	132
3.2. Solution of the sets of differential equations of stability of the analogy method for thin walled bars with rigidity variable by the length	133
3.3. The qualitative method of solution of some equations on stability of bars	143
3.4. General informations about frame/beam bridges and description of their constructions	154
3.5. Calculation on stability of the span structure of the fram ^e eam bridge	161
3.6. The computer programs at calculation of the bridge's girder on stability	171
3.7. The forces effecting for carrier rocket in flight	172
3.8. The forces effecting an aircraft in flight	175
3.9. On selection of the design model of construction elements of flying apparatus at calculation on stability	178
3.10. The calculation on stability of a carrier rocket	182
3.11. Calculation on stability of construction elements of the aircraft	189
Chapter IV. Corrections provided by new concepts on state of the problems on strength, stability and dynamics of thin-walled constructions	200
4.1. LaGrange—Castiliano's principle in the theory of elasticity	200
4.2. A variational method in construction mechanics	202
4.3. The corrections provided by new concepts to a state of the problem on strength of thin walled bars	206
4.4. The corrections provided by new concepts to the state of a problem on stability and oscillations of thin walled constructions	206
Conclusion	210
